

The figure is a time series plot with 'time (days)' on the x-axis (0 to 1200) and an unlabeled y-axis. It compares 'data' (blue line) and 'model' (red line). The data shows high-frequency oscillations. The model follows the data closely in some regions but shows significant deviations, notably being much higher than the data between days 200 and 350, and between days 750 and 950. A legend in the top right corner identifies the two series.
